Knapp Rehabilitation Center
Brain Injury Outcomes 2019

This brain injury information includes traumatic brain injuries and non-traumatic brain injuries including conditions such as encephalopathies caused by loss of oxygen to the brain or tumors. Combined, the traumatic and non-traumatic brain injured individuals represented 25% of the persons served at Knapp Rehab in 2019. The average age of patients served at Knapp with brain injury was 56. The average age of brain injured persons nationally served in facilities that Knapp is compared with is 68 years old. Knapp served 1 adolescent between the ages 13 and 17 in 2019 for brain injury rehabilitation.

The individual's abilities representing 18 daily living functions are scored at the beginning of the rehab program and at time of discharge. Examples of the abilities scored include getting dressed, toileting, and walking. Persons who have experienced impairments of thinking as a result of a brain injury or brain condition require a consistent, coordinated approach to their rehabilitation. The persons who participated in the Knapp program made progress between admission and discharge as shown on this bar graph compared with rehab centers in the nation who participate in the same scoring system.
Brain injury patients participated in the Knapp program an average of 14 days.

In 2019, 77% of brain injury patients treated at Knapp were discharged to home. Most of the patients who were discharged to home received outpatient therapy to continue progress. Some were discharged to a sub-acute rehabilitation setting in long term care facilities to continue therapy on a daily basis until they were able to go to their homes.
