Miland E. Knapp Rehabilitation Center
Stroke Outcomes 2019

In 2019, 32% of the patients cared for in Knapp were there as a result as suffering a stroke. Nationally, the percent of stroke patients treated in rehabilitation centers Knapp was compared with is 24%. The average age of those we serve with stroke at Knapp is 64 compared with the national average age of stroke patients in compared facilities of 69 years.

The functional abilities for stroke patients are measured first on admission and at discharge. The difference in those numbers is the functional gain. Knapp’s average score in this area compare closely with the national average.
Individuals with stroke stay in the program an average of 17 days which is longer than the average of all the patients in the program. The impairments as a result of stroke limit activities that are common to daily living. A coordinated program of therapy and nursing care is required.

Approximately 82% of the patients discharged from Knapp either return home with a schedule of outpatient therapies (49%) or transfer to a less intensive facility to continue rehabilitative therapy until they can return home (33%).
